## Technical Notes

### What is Consumer Price Index (CPI)?

The CPI is an indicator of the change in the average retail prices of a fixed basket of goods and services commonly purchased by households relative to a base year.

### What are the uses of CPI?

The CPI is most widely used in the calculation of the inflation rate and purchasing power of the peso. It is a major statistical series used for economic analysis and as a monitoring indicator of government economic policy.

### How is the CPI computed?

The CPI is computed using the weighted arithmetic mean of price relatives, a variant of the Laspeyres formula with fixed base year period weights. In computing the CPI, the formula is

$$CPI = \frac{\sum [(P_n/P_o)W]}{\sum (W)} \times 100$$

where:

$P_n$  = current price

$P_o$  = base period price

$W$  =  $P_oQ_o$  = weights

**Base Period** - a reference date or simply a convenient benchmark to which a continuous series of index numbers can be related. The base period is year, and the index is taken as equal to 100. The present series uses 2012 as the base year.

**Market Basket** - selected sample of the varieties of goods purchased by consumption and services availed by households in the country to represent the composite price behavior of all goods and services purchased by consumers.

**Weighting System** - a desirable system that considers the relevance of the components of the index. For the CPI, the weighting pattern uses the expenditures on various consumer items purchased by households as a proportion to total expenditure.

### What is Inflation Rate?

Inflation rate is the annual rate of change or the year-on-year change of the CPI expressed in percent. That is,

$$\text{Inflation Rate} = \frac{CPI_2 - CPI_1}{CPI_1} \times 100$$

where:

$CPI_1$  - is the CPI in the Previous period

$CPI_2$  - is the CPI in the Current period

*"Inflation is the overall rise in the prices of goods and services overtime. An overall rise in prices overtime, then reduces the purchasing power of consumers."*
